NAG Library Function Document

nag_zgbbrd (f08lsc)

1 Purpose

nag_zgbbrd (f08lsc) reduces a complex m by n band matrix to real upper bidiagonal form.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_zgbbrd (Nag_OrderType order, Nag_VectType vect, Integer m, Integer n,
     Integer ncc, Integer kl, Integer ku, Complex ab[], Integer pdab,
     double d[], double e[], Complex q[], Integer pdq, Complex pt[],
     Integer pdpt, Complex c[], Integer pdc, NagError *fail)
```

3 Description

nag_zgbbrd (f08lsc) reduces a complex m by n band matrix to real upper bidiagonal form B by a unitary transformation: $A = QBP^{\mathrm{H}}$. The unitary matrices Q and P^{H}, of order m and n respectively, are determined as a product of Givens rotation matrices, and may be formed explicitly by the function if required. A matrix C may also be updated to give $\tilde{C} = Q^{\mathrm{H}}C$.

The function uses a vectorizable form of the reduction.

4 References

None.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **vect** – Nag_VectType *Input*

On entry: indicates whether the matrices Q and/or P^{H} are generated.

vect = Nag_DoNotForm
Neither Q nor P^{H} is generated.

vect = Nag_FormQ
Q is generated.

vect = Nag_FormP
P^{H} is generated.

vect = Nag_FormBoth
Both Q and P^{H} are generated.

Constraint: **vect** = Nag_DoNotForm, Nag_FormQ, Nag_FormP or Nag_FormBoth.

3: **m** – Integer *Input*

On entry: m, the number of rows of the matrix A.

Constraint: $\mathbf{m} \geq 0$.

4: **n** – Integer *Input*

On entry: n, the number of columns of the matrix A.

Constraint: $\mathbf{n} \geq 0$.

5: **ncc** – Integer *Input*

On entry: n_C, the number of columns of the matrix C.

Constraint: $\mathbf{ncc} \geq 0$.

6: **kl** – Integer *Input*

On entry: the number of subdiagonals, k_l, within the band of A.

Constraint: $\mathbf{kl} \geq 0$.

7: **ku** – Integer *Input*

On entry: the number of superdiagonals, k_u, within the band of A.

Constraint: $\mathbf{ku} \geq 0$.

8: **ab**[*dim*] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **ab** must be at least

$\max(1, \mathbf{pdab} \times \mathbf{n})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pdab})$ when **order** = Nag_RowMajor.

On entry: the original m by n band matrix A.

This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements A_{ij}, for row $i = 1, \ldots, m$ and column $j = \max(1, i - k_l), \ldots, \min(n, i + k_u)$, depends on the **order** argument as follows:

if **order** = Nag_ColMajor, A_{ij} is stored as $\mathbf{ab}[(j-1) \times \mathbf{pdab} + \mathbf{ku} + i - j]$;

if **order** = Nag_RowMajor, A_{ij} is stored as $\mathbf{ab}[(i-1) \times \mathbf{pdab} + \mathbf{kl} + j - i]$.

On exit: **ab** is overwritten by values generated during the reduction.

9: **pdab** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **ab**.

Constraint: $\mathbf{pdab} \geq \mathbf{kl} + \mathbf{ku} + 1$.

10: **d**[$\min(\mathbf{m}, \mathbf{n})$] – double *Output*

On exit: the diagonal elements of the bidiagonal matrix B.

11: **e**[$\min(\mathbf{m}, \mathbf{n}) - 1$] – double *Output*

On exit: the superdiagonal elements of the bidiagonal matrix B.

12: **q**[*dim*] – Complex *Output*

Note: the dimension, *dim*, of the array **q** must be at least

$\max(1, \mathbf{pdq} \times \mathbf{m})$ when **vect** = Nag_FormQ or Nag_FormBoth;
1 otherwise.

The (i,j)th element of the matrix Q is stored in

q$[(j-1) \times$ **pdq** $+ i - 1]$ when **order** = Nag_ColMajor;
q$[(i-1) \times$ **pdq** $+ j - 1]$ when **order** = Nag_RowMajor.

On exit: if **vect** = Nag_FormQ or Nag_FormBoth, contains the m by m unitary matrix Q.

If **vect** = Nag_DoNotForm or Nag_FormP, **q** is not referenced.

13: **pdq** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **q**.

Constraints:

if **vect** = Nag_FormQ or Nag_FormBoth, **pdq** $\geq \max(1, \mathbf{m})$;
otherwise **pdq** ≥ 1.

14: **pt**[*dim*] – Complex *Output*

Note: the dimension, *dim*, of the array **pt** must be at least

$\max(1, \mathbf{pdpt} \times \mathbf{n})$ when **vect** = Nag_FormP or Nag_FormBoth;
1 otherwise.

The (i,j)th element of the matrix is stored in

pt$[(j-1) \times$ **pdpt** $+ i - 1]$ when **order** = Nag_ColMajor;
pt$[(i-1) \times$ **pdpt** $+ j - 1]$ when **order** = Nag_RowMajor.

On exit: the n by n unitary matrix P^{H}, if **vect** = Nag_FormP or Nag_FormBoth. If **vect** = Nag_DoNotForm or Nag_FormQ, **pt** is not referenced.

15: **pdpt** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **pt**.

Constraints:

if **vect** = Nag_FormP or Nag_FormBoth, **pdpt** $\geq \max(1, \mathbf{n})$;
otherwise **pdpt** ≥ 1.

16: **c**[*dim*] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **c** must be at least

$\max(1, \mathbf{pdc} \times \mathbf{ncc})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pdc})$ when **order** = Nag_RowMajor.

The (i,j)th element of the matrix C is stored in

c$[(j-1) \times$ **pdc** $+ i - 1]$ when **order** = Nag_ColMajor;
c$[(i-1) \times$ **pdc** $+ j - 1]$ when **order** = Nag_RowMajor.

On entry: an m by n_C matrix C.

On exit: **c** is overwritten by $Q^{\mathrm{H}}C$. If **ncc** $= 0$, **c** is not referenced.

17: **pdc** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **c**.

Constraints:

if **order** = Nag_ColMajor,
if **ncc** > 0, **pdc** $\geq \max(1, \mathbf{m})$;
if **ncc** $= 0$, **pdc** ≥ 1;

if **order** = Nag_RowMajor, **pdc** $\geq \max(1, \mathbf{ncc})$.

18: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_ENUM_INT_2

On entry, **vect** = ⟨*value*⟩, **pdpt** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **vect** = Nag_FormP or Nag_FormBoth, **pdpt** $\geq \max(1, \mathbf{n})$;
otherwise **pdpt** ≥ 1.

On entry, **vect** = ⟨*value*⟩, **pdq** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: if **vect** = Nag_FormQ or Nag_FormBoth, **pdq** $\geq \max(1, \mathbf{m})$;
otherwise **pdq** ≥ 1.

NE_INT

On entry, **kl** = ⟨*value*⟩.
Constraint: **kl** ≥ 0.

On entry, **ku** = ⟨*value*⟩.
Constraint: **ku** ≥ 0.

On entry, **m** = ⟨*value*⟩.
Constraint: **m** ≥ 0.

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

On entry, **ncc** = ⟨*value*⟩.
Constraint: **ncc** ≥ 0.

On entry, **pdab** = ⟨*value*⟩.
Constraint: **pdab** > 0.

On entry, **pdc** = ⟨*value*⟩.
Constraint: **pdc** > 0.

On entry, **pdpt** = ⟨*value*⟩.
Constraint: **pdpt** > 0.

On entry, **pdq** = ⟨*value*⟩.
Constraint: **pdq** > 0.

NE_INT_2

On entry, **pdc** = ⟨*value*⟩ and **ncc** = ⟨*value*⟩.
Constraint: **pdc** $\geq \max(1, \mathbf{ncc})$.

NE_INT_3

On entry, **ncc** = ⟨*value*⟩, **pdc** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: if **ncc** > 0, **pdc** $\geq \max(1, \mathbf{m})$;
if **ncc** $= 0$, **pdc** ≥ 1.

On entry, **pdab** = ⟨*value*⟩, **kl** = ⟨*value*⟩ and **ku** = ⟨*value*⟩.
Constraint: **pdab** $\geq$ **kl** + **ku** + 1.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

The computed bidiagonal form B satisfies $QBP^{\mathrm{H}} = A + E$, where

$$\|E\|_2 \leq c(n)\epsilon\|A\|_2,$$

$c(n)$ is a modestly increasing function of n, and ϵ is the ***machine precision***.

The elements of B themselves may be sensitive to small perturbations in A or to rounding errors in the computation, but this does not affect the stability of the singular values and vectors.

The computed matrix Q differs from an exactly unitary matrix by a matrix F such that

$$\|F\|_2 = O(\epsilon).$$

A similar statement holds for the computed matrix P^{H}.

8 Further Comments

The total number of real floating point operations is approximately the sum of:

$20n^2k$, if **vect** = Nag_DoNotForm and **ncc** $= 0$, and

$10n^2n_C(k-1)/k$, if C is updated, and

$10n^3(k-1)/k$, if either Q or P^{H} is generated (double this if both),

where $k = k_l + k_u$, assuming $n \gg k$. For this section we assume that $m = n$.

The real analogue of this function is nag_dgbbrd (f08lec).

9 Example

This example reduces the matrix A to upper bidiagonal form, where

$$A = \begin{pmatrix} 0.96 - 0.81i & -0.03 + 0.96i & 0.00 + 0.00i & 0.00 + 0.00i \\ -0.98 + 1.98i & -1.20 + 0.19i & -0.66 + 0.42i & 0.00 + 0.00i \\ 0.62 - 0.46i & 1.01 + 0.02i & 0.63 - 0.17i & -1.11 + 0.60i \\ 0.00 + 0.00i & 0.19 - 0.54i & -0.98 - 0.36i & 0.22 - 0.20i \\ 0.00 + 0.00i & 0.00 + 0.00i & -0.17 - 0.46i & 1.47 + 1.59i \\ 0.00 + 0.00i & 0.00 + 0.00i & 0.00 + 0.00i & 0.26 + 0.26i \end{pmatrix}.$$
