NAG Library Function Document

nag_search_int (m01nbc)

1 Purpose

nag_search_int (m01nbc) searches an ordered vector of integer numbers and returns the index of the first value equal to the sought-after item.

2 Specification

```
#include <nag.h>
#include <nagm01.h>
Integer nag_search_int (Nag_Boolean validate, const Integer iv[], Integer m1,
        Integer m2, Integer item, NagError *fail)
```

3 Description

nag_search_int (m01nbc) is based on Professor Niklaus Wirth's implementation of the Binary Search algorithm (see Wirth (2004)), but with two modifications. First, if the sought-after item is less than the value of the first element of the array to be searched, -1 is returned. Second, if a value equal to the sought-after item is not found, the index of the immediate lower value is returned.

4 References

5 Arguments

1: **validate** – Nag_Boolean *Input*

On entry: if **validate** is set to Nag_TRUE argument checking will be performed. If **validate** is set to Nag_FALSE nag_search_int (m01nbc) will be called without argument checking (which includes checking that array **iv** is sorted in ascending order) and the function will return with **fail.code** = NE_NOERROR. See Section 9 for further details.

2: **iv**[**m2** + 1] – const Integer *Input*

On entry: elements **m1** to **m2** contain integer values to be searched.

Constraint: elements **m1** to **m2** of **iv** must be sorted in ascending order.

3: **m1** – Integer *Input*

On entry: the index of the first element of **iv** to be searched.

Constraint: **m1** ≥ 0.

4: **m2** – Integer *Input*

On entry: the index of the last element of **iv** to be searched.

Constraint: **m2** $\geq$ **m1**.

5: **item** – Integer *Input*

On entry: the sought-after item.

6: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, **m1** = ⟨*value*⟩.
Constraint: **m1** ≥ 0.

NE_INT_2

On entry, **m1** = ⟨*value*⟩, **m2** = ⟨*value*⟩.
Constraint: **m1** $\leq$ **m2**.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_NOT_INCREASING

On entry, **iv** must be sorted in ascending order: **iv** element ⟨*value*⟩ $>$ element ⟨*value*⟩.

7 Accuracy

Not applicable.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The argument **validate** should be used with caution. Set it to Nag_FALSE only if you are confident that the other arguments are correct, in particular that array **iv** is in fact arranged in ascending order. If you wish to search the same array **iv** many times, you are recommended to set **validate** to Nag_TRUE on first call of nag_search_int (m01nbc) and to Nag_FALSE on subsequent calls, in order to minimize the amount of time spent checking **iv**, which may be significant if **iv** is large.

The time taken by nag_search_int (m01nbc) is $O(\log(n))$, where $n = \mathbf{m2} - \mathbf{m1} + 1$, when **validate** = Nag_FALSE.

10 Example

This example reads a list of integer numbers and sought-after items and performs the search for these items.

10.1 Program Text

```
/* nag_search_int (m01nbc) Example Program.

 */
/* Pre-processor includes */
```

```
#include <stdio.h>
#include <math.h>
#include <nag.h>
#include <nag_stdlib.h>
#include <nagm01.h>

int main(void)
{
  /*Logical scalar and array declarations */
  Nag_Boolean validate;
  /*Integer scalar and array declarations */
  Integer     exit_status = 0;
  Integer     i, index, item, leniv, m1, m2;
  Integer     *iv = 0;
  NagError    fail;

  INIT_FAIL(fail);

  printf("%s\n", "nag_search_int (m01nbc) Example Program Results");
  printf("\n");
  scanf("%*[^\n] ");
  scanf("%ld%*[^\n] ", &leniv);
  if (!(iv = NAG_ALLOC(leniv, Integer)))
    {
      printf("Allocation failure\n");
      exit_status = -1;
      goto END;
    }
  /* Read in Reference Vector iv*/
  for (i = 0; i < leniv; i++)
    scanf("%ld ", &iv[i]);
  scanf("%*[^\n] ");
  /* Read items sought in the reference vector*/
  validate = Nag_TRUE;
  m1 = 0;
  m2 = leniv-1;
  while (scanf("%ld%*[^\n] ", &item) != EOF)
    {
      /*
       * nag_search_int (m01nbc)
       * Binary search in set of integer numbers
       */
      index = nag_search_int(validate, iv, m1, m2, item, &fail);
      if (fail.code != NE_NOERROR)
        {
          printf("Error from nag_search_int (m01nbc).\n%s\n",
                  fail.message);
          exit_status = 1;
          goto END;
        }
      if (validate)
        {
          /* Print the reference vector*/
          printf("%s\n", "Reference Vector is:");
          for (i = 0; i < leniv; i++)
            printf("%5ld%s", iv[i], (i+1)%8?" ":"\n");
          printf("\n");
          validate = Nag_FALSE;
        }
      printf("\n");
      printf("  Search for item %5ld returned index: %4ld\n", item,
              index);
    }

 END:
  NAG_FREE(iv);

  return exit_status;
}
```

10.2 Program Data

```
nag_search_int (m01nbc) Example Program Data
16                                                      : leniv
5  6  11  12  13  13  21  23
23  41  58  59  65  65  86  99                          : iv
21                                                      : item 1
