

NAG Library Routine Document

A02ABF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

A02ABF returns the value of the modulus of the complex number $x = (x_r, x_i)$.

2 Specification

```
FUNCTION A02ABF (XR, XI)
REAL (KIND=nag_wp) A02ABF
REAL (KIND=nag_wp) XR, XI
```

3 Description

The function evaluates $\sqrt{x_r^2 + x_i^2}$ by using $a\sqrt{1 + (\frac{b}{a})^2}$ where a is the larger of $|x_r|$ and $|x_i|$, and b is the smaller of $|x_r|$ and $|x_i|$. This ensures against unnecessary overflow and loss of accuracy when calculating $(x_r^2 + x_i^2)$.

4 References

Wilkinson J H and Reinsch C (1971) *Handbook for Automatic Computation II, Linear Algebra* Springer-Verlag

5 Arguments

1: XR – REAL (KIND=nag_wp) Input
2: XI – REAL (KIND=nag_wp) Input

On entry: x_r and x_i , the real and imaginary parts of x , respectively.

6 Error Indicators and Warnings

None.

7 Accuracy

The result should be correct to *machine precision*.

8 Parallelism and Performance

A02ABF is not threaded in any implementation.

9 Further Comments

None.

10 Example

This example finds the modulus of $-1.7 + 2.6i$.
